```
#include <iostream>
#include <iomanip>
#include <limits>
using namespace std;

int main() {
   int a = 7, b = 2;

   // Implicit integer division followed by conversion to double
   double c = a / b;

   // Explicit conversion before division
   double d = static_cast<double>(a) / b;

   cout << c << " " << d << '\n';

   // Character promotion to int
   char ch = 'A' + 2;
   cout << ch << " " << ch + 1 << '\n';

   // Integer to bool conversion
   bool flag = 5;
   cout << flag << " " << boolalpha << flag << '\n';

   // Signed and unsigned comparison
   unsigned int u = 1;
   int s = -1;
   cout << (s < u ? "s < u" : "s >= u") << '\n';

   // Explicit conversion examples
```

```
    double value = 9.8;
    int converted = static_cast<int>(value);
    cout << "Explicit conversion: " << converted << '\n';

    // Brace initialization prevents narrowing
    int validNumber{3};
    cout << "Brace initialization: " << validNumber << '\n';

    // Demonstrate overflow-safe range information
    cout << "Maximum int: "
        << numeric_limits<int>::max() << '\n';

    return 0;
}
```
